Native response deadline: inspect the negative result

Maintainer workflow for the fixed credential-free fixture. Requires a separately authorized isolated executor, pinned native client and new private output directory. Screenshots render sanitized actual CLI/native evidence in a browser; they are not terminal images or real model results.

1. Select the scenario and retain the blocked receipt

Use the fixture guide to prepare command/executor argv in a private plan. Set scenario to response-deadline-after-tools and keep a finite timeout. Run native_execution.py --plan /path/to/plan.json --output /path/to/new-evidence. Read receipt.json even when the CLI exits 1. The capture below used a local fake app-server.

Actual public CLI with a fake process: the expected negative result is blocked with Refusal:deadline. The display is a browser-rendered summary, not terminal output.

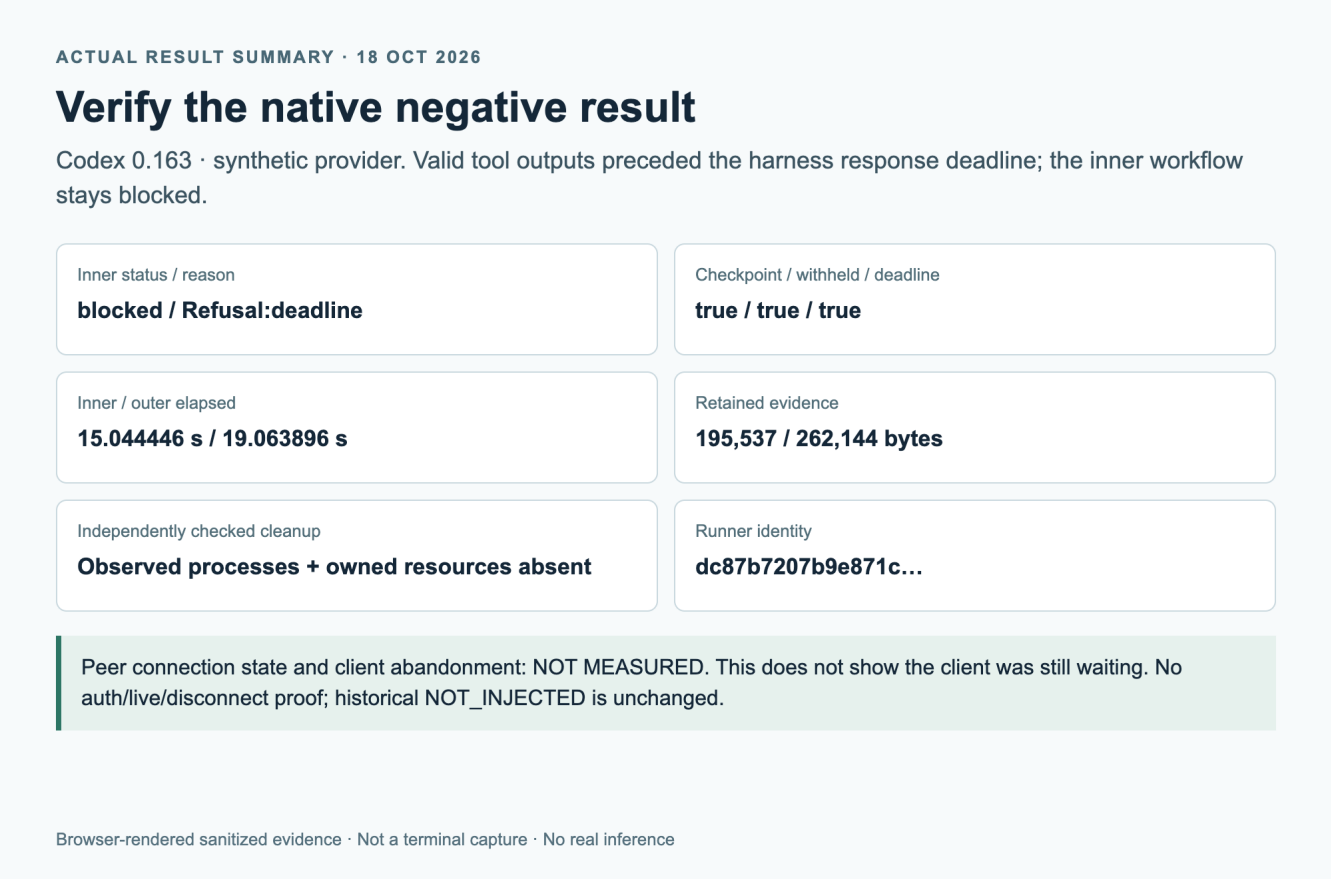

Expected result: Checkpoint, response_withheld and deadline_reached must all be true. A setup timeout or early harness close is insufficient. Peer connection state and client abandonment are NOT MEASURED. Keep the blocked result and cleanup uncertainty.

Native response deadline: inspect the negative result

Maintainer workflow for the fixed credential-free fixture. Requires a separately authorized isolated executor, pinned native client and new private output directory. Screenshots render sanitized actual CLI/native evidence in a browser; they are not terminal images or real model results.

2. Match the native source and independently check cleanup

Match the runtime hash before reusing evidence. The native run reached valid assigned skill body/reference and disabled-collaboration tool outputs. The harness then withheld the final synthetic response until its original 15-second deadline. Check these harness facts and exact owned-resource absence together.

Actual native negative-path summary on runtime dc87b7207b9e871c. The 195,537-byte supervisor total includes inner events/receipt and outer command/cleanup JSON; it is not a wire or token limit.

Expected result: Targeted harness response-deadline check passed; the inner receipt remains blocked. Peer connection state and client abandonment are NOT MEASURED; this does not show the client was still waiting. No auth, live inference, executor-disconnect or full-route claim. Historical NOT_INJECTED evidence is unchanged.
