Review and export a synthetic case

Scenario: reviewed-cases / workflow-map. Historical screenshots captured 2026-10-18 on a candidate based on main 48b854b. Text refreshed after inheriting feedback correction 57173d8. Use Python 3.11+, a disposable home and explicit synthetic inputs; no model call.

1. Inspect the case boundary

Open docs/map/workflow.html and choose 2. Case / reviewed export. Expand its details. Follow Sources to the improvement design and the authoritative observation guide for cases.py request fields.

Historical actual map dialog. Explicit reviewed case export remains available; automatic triage and model evaluation remain planned. Current inherited cleanup rules are stated below.

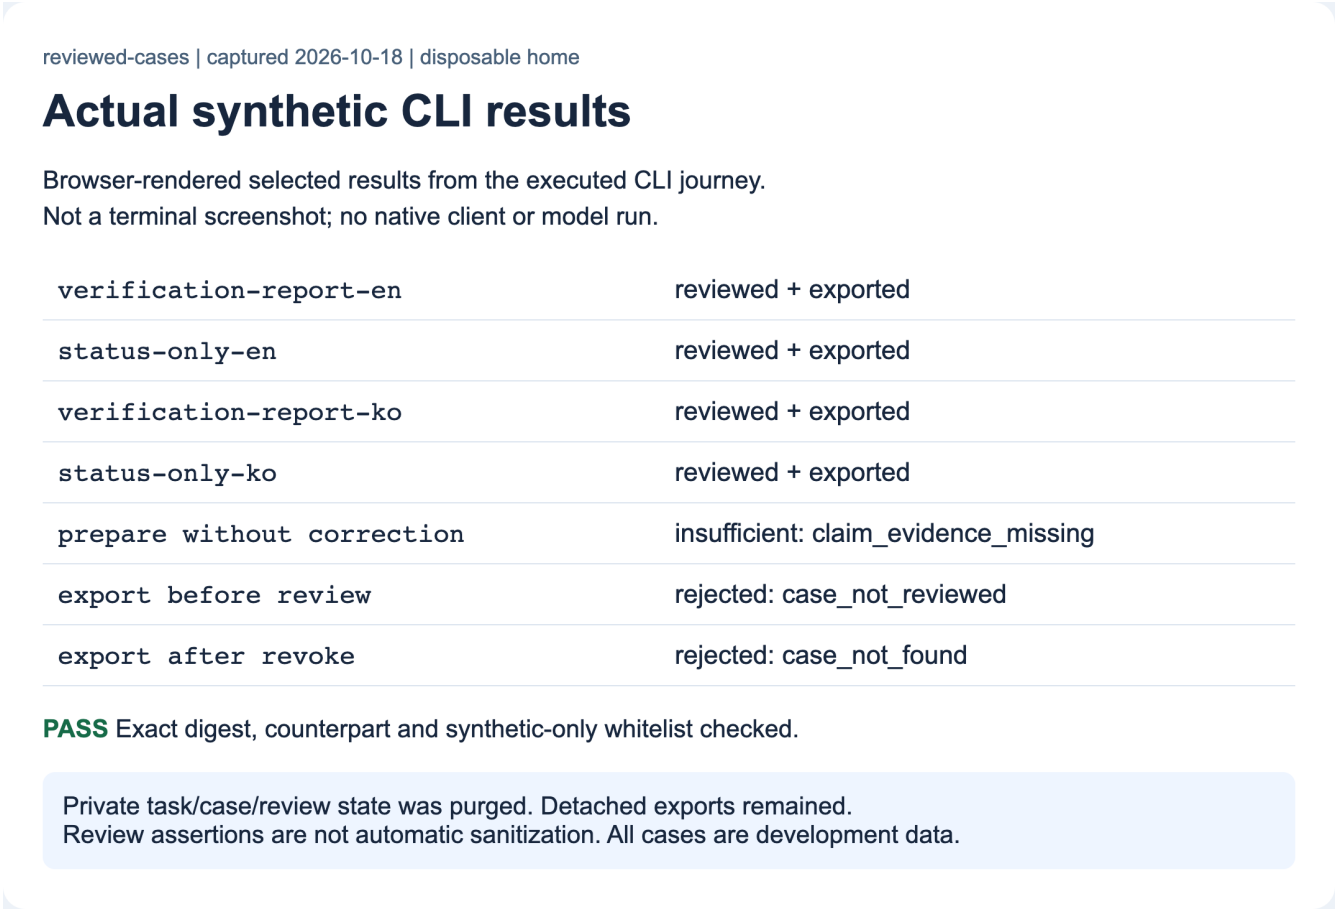

Expected result: A case binds one task revision and selected correction feedback. Supply the synthetic reproduction, outcome contract and successful or contrary counterpart yourself.

Review and export a synthetic case

Scenario: reviewed-cases / workflow-map. Historical screenshots captured 2026-10-18 on a candidate based on main 48b854b. Text refreshed after inheriting feedback correction 57173d8. Use Python 3.11+, a disposable home and explicit synthetic inputs; no model call.

2. Review exact bytes, export, then revoke

Run prepare --task with the selected revision, feedback IDs and synthetic payload, then show --task --case. Inspect every field and the counterpart. Review the exact digest with both confirmation flags; export to a new absolute path. Revoke the grant after the disposable check.

Historical browser summary of actual bilingual CLI results, not a terminal or live efficacy result. A fresh integrated CLI journey passed after the inherited feedback correction.

Expected result: Missing correction stays insufficient; unreviewed export is refused. Public fields remain synthetic development data. Revoke purges private lineage and blocks late export; expiry disables access immediately and prune removes retained private bytes. Detached exports remain independent.
