Bind observations and record feedback

Scenario: task-feedback / workflow-map. Screenshots captured 2026-10-18 on a candidate based on main 48b854b. Text corrected after PR33 review. Use Python 3.11+ and a disposable home. Captures remain historical; current guidance below supersedes earlier cleanup wording.

1. Find the task commands

Open docs/map/workflow.html. Under Self-improvement and eval, open Private observations and expand its details. Follow Sources to account/observation/README.md for the command contract.

Historical actual map dialog. Command navigation remains applicable. Its older expiry/purge wording is superseded: expiry disables access immediately; prune performs physical deletion.

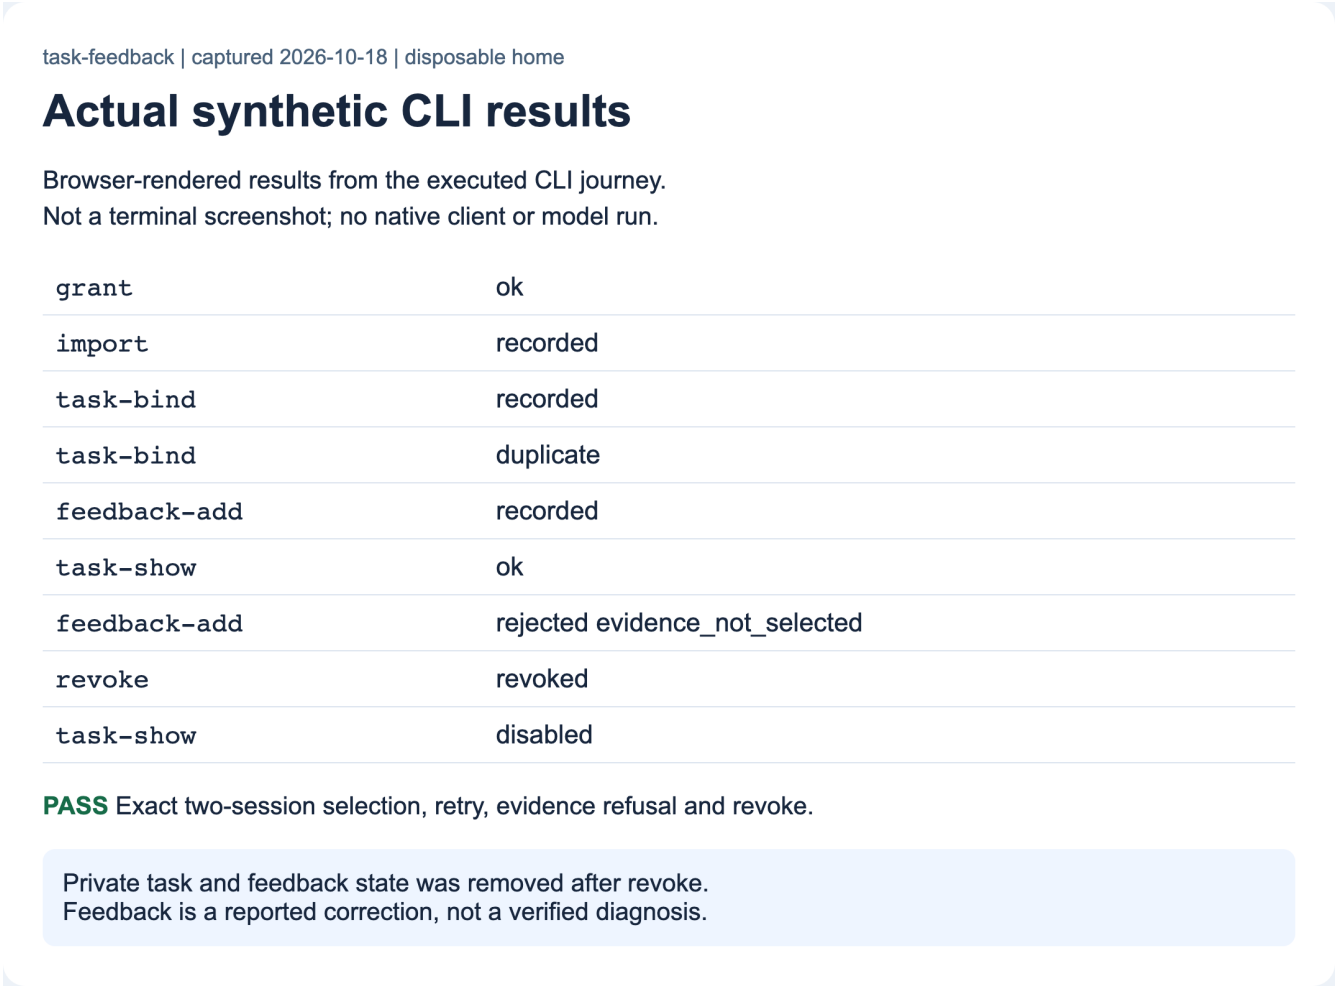

Expected result: Bind exact events or an inclusive receipt range. Stored rows must fit 128 KiB after encoding; larger resolved rows are refused. feedback-add accepts an omitted/null revision or a valid existing revision token.

Bind observations and record feedback

Scenario: task-feedback / workflow-map. Screenshots captured 2026-10-18 on a candidate based on main 48b854b. Text corrected after PR33 review. Use Python 3.11+ and a disposable home. Captures remain historical; current guidance below supersedes earlier cleanup wording.

2. Select, review and revoke

Grant a disposable synthetic project and import events from two sessions. Bind only the intended events, repeat the request to check idempotency, then add feedback and inspect task-show. Reject unselected evidence. Revoke the grant when finished.

Historical browser summary of an actual synthetic CLI run, not a terminal capture. Separate post-review CLI checks verified corrupt/symlink cleanup and malformed revision refusal.

Expected result: Retry is stable; unselected evidence is rejected. Revoke purges private tasks and feedback. Expiry requires prune for physical deletion. Corrupt unknown-lineage tasks are removed without following symlinks; valid unrelated tasks remain.
